Loading the data and any packages

```
options("max.print"=3)
suppressMessages(library(tidyverse))
suppressMessages(library(magrittr))
suppressMessages(library(leaps))
suppressMessages(library(VIM))
suppressMessages(library(car))
suppressMessages(library(Hmisc))
suppressMessages(library(glmnet))
house <- read_csv("housing.txt", col_types = cols())
names(house) <- tolower(names(house))</pre>
```

Convert mssubclass to factor and check for NAs

```
house$mssubclass <- factor(house$mssubclass)
house %>% sapply(function(x) sum(is.na(x))) %>% sort(decreasing = T)
```

```
## poolqc miscfeature alley
## 1453 1406 1369
## [reached getOption("max.print") -- omitted 78 entries ]
```

Convert numeric variables that have NA to 0. Change garageyrblt to indicate whether or not the garage was built AFTER the house was built.

```
house$masvnrarea[which(is.na(house$masvnrarea))] <- 0
house$bsmtfintype1[which(is.na(house$bsmtfintype1))] <- 0
house$bsmtfintype2[which(is.na(house$bsmtfintype2))] <- 0
house$garageyrblt <- (house$garageyrblt > house$yearbuilt) * 1
house$garageyrblt[is.na(house$garageyrblt)] <- 0</pre>
```

Impute the NA in lotfrontage, electrical with K-Nearest Neighbors

```
k = round(sqrt(1460*.8) / 2)
house$lotfrontage <- kNN(house, variable = "lotfrontage", k = k)$lotfrontage
house$electrical <- kNN(house, variable = "electrical", k = k)$electrical</pre>
```

```
Convert all other NAs to "None"
```

```
house[is.na(house)] <- "None"
```

Make a new variable, remodel that indicates whether or not remodeling took place. Remove the yearremodadd variable because it is no longer needed. Make a new variable soldminusbuilt that indicates the number of years that it took for the house to get sold after getting built.

```
house$remodel <- T
house[house$yearbuilt == house$yearremodadd,]$remodel <- F
house %<>% select(-yearremodadd)

house$soldminusbuilt <- (house$yrsold - house$yearbuilt)
house %<>% select(-yrsold,-yearbuilt)
```

Combine all of the porch variables into one. Remove id because it is obviously not important.

Change lotshape to a boolean whether or not it is Regular.

```
table(house$lotshape)

##

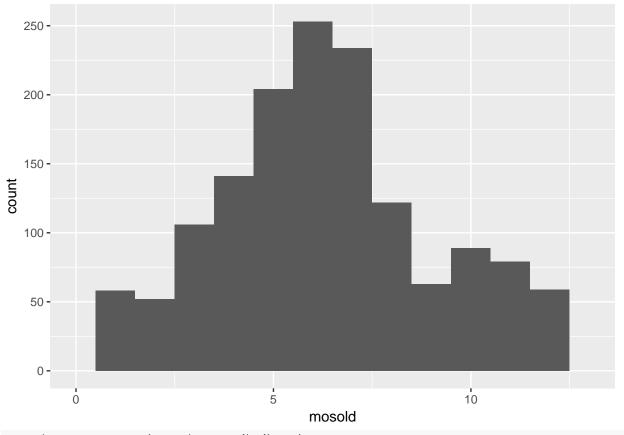

## IR1 IR2 IR3 Reg

## 484 41 10 925

house$lotshape <- (house$lotshape == 'Reg') *1</pre>
```

Looking at the histogram of mosold we see many more houses being sold near summer time (and part of spring too) so we create a boolean. Most of the time, when we are creating a boolean, it is because it is insignificant otherwise.

house\$summertime <- (house\$mosold %in% 5:7) * 1

The next part of the code was very time-consuming but here's the general outline: It is similar to backwards selection but by hand and possibly more thorough because of the refactoring involved rather than simply removing it.

- 1. Check the p-value and signifiance for a particlar variable.
- 2. If the variable is numeric and significant, keep it. If the variable is categorical and all levels are significant, keep it. If only some levels are significant then try to bin the factors into smaller number of

levels to try and make them statistically significant. If nothing can be done, then remove the variable.

- 3. Repeat the above steps for the rest of the variables. Each time we remove a variable, we re-run the lm model to check if the Adjusted R Squared changed significantly or not.
- 4. When we finish going through all the variables, there will be about 30 ones left to consider.

```
house %<>% select(-mosold, -landcontour, -alley, -lotshape)

house$lotconfig <- (house$lotconfig == "Inside") * 1
house %<>% select(-lotconfig)
```

Here, we noticed lotfrontage became significant when we take the square root. We remove 1stflrsf, 2ndflrsf, lowqualfinsf because they make up the variable grlivarea. At first, we tried having all three of them and deleting grlivarea however we found that having just grlivarea performed better. We are deleting the porch variables because we have already aggregated them into porcharea.

```

Here, I am changing the ordered factor into numeric. I want to make a correlation plot with every significant variable so I am converting all variables (as long as it makes sense) to numeric.

Here, fireplacequ and fireplaces are obviously correlated so I choose the one that seems to explain saleprice better. However, they both end up being insignificant.

house %<>% select(-garagefinish)

```
house$fireplacequ <- as.numeric(factor(house$fireplacequ,
    levels = c("None","Po","Fa","TA","Gd","Ex"), labels = 0:5))
cor(house$saleprice,house$fireplacequ); cor(house$saleprice,house$fireplaces)

## [1] 0.5204376

## [1] 0.4669288
house %<>% select(-fireplacequ, -fireplaces)
house %<>% select(-garageyrblt)
house$garagetype <- relevel(factor(house$garagetype), ref = "None")</pre>
```

```
house$functional <- (house$functional == "Typ") * 1
house$kitchenqual <- as.numeric(factor(house$kitchenqual,
    levels = c("Po","Fa","TA","Gd","Ex"), labels = 1:5))
Similarly, totrmsabvgrd is highly correlated with grlivarea so I keep the better of the two.

Normal Q-Q Plot

Checking with LASSO if any variables to remove. Although LASSO recommends to delete bsmtunsf and bedroomabvgr, removing them lowers the R squared so I will keep them. Many of the neighborhoods are in fact significant so I will leave the non-significant levels in the model anyway.

```
lassorefactor <- function(){</pre>
x <- model.matrix(saleprice ~ ., data = house4)[,-1]</pre>
 y <- house$saleprice
 train <- sample(1:nrow(x), nrow(x) / 2)</pre>
 test <- (-train)</pre>
 y.train <- y[train]</pre>
 y.test <- y[test]</pre>
